PHOOD

Tokenomics & IDO Framework | Version 7.0 | October 19, 2026

TOTAL SUPPLY	REFERENCE FDV
1,000,000,000 PHOOD	**$250,000**
PUBLIC IDO ALLOCATION	FUNDRAISING TARGET
20% maximum	**$10,000 - $50,000**

1. Token allocation

Category	Allocation	Tokens
Public IDO	20%	200,000,000
DEX liquidity	15%	150,000,000
Game rewards	5%	50,000,000
Community & ecosystem reserve	35%	350,000,000
Marketing & KOL	5%	50,000,000
Team	10%	100,000,000
Project treasury	10%	100,000,000
Total	100%	1,000,000,000

2. Game rewards: 5% in total

Campaign	Supply share	Token budget
Initial Play-to-Launch airdrop	2%	20,000,000
Post-launch trading competitions	2%	20,000,000
Future games and competitions	1%	10,000,000

Unallocated or unused campaign tokens remain in the applicable reward reserve until an announced distribution. Trading competitions should incorporate anti-wash-trading rules.

3. Public IDO terms

Parameter	Agreed framework
Reference token price	$0.00025 per PHOOD

Parameter	Agreed framework
Reference fully diluted valuation	$250,000
Fundraising target / hard cap	$10,000 target floor / $50,000 maximum proceeds
Token sale limit	Up to 200,000,000 PHOOD (20%), including voucher bonus tokens
Game-earned voucher discount	Up to 20% off; estimated average effective discount ~10%
Unsold IDO allocation	Transferred to the community & ecosystem reserve under reserve controls

At an average 10% effective discount, selling all 200M allocated tokens would raise approximately $45,000, rather than $50,000. The sale ends when either the token allocation or the $50,000 proceeds cap is reached.

IDO mechanics & vesting

Distinct unlock schedules for purchased tokens and game-voucher bonus tokens.

4. Two independent IDO allocations

Component	Calculation	Unlock schedule
Base purchased allocation	USDT paid / $0.00025	30% at TGE; remaining 70% vested linearly over the next 3 months; no cliff
Voucher bonus allocation	Total discounted token entitlement minus base purchased allocation	0% at TGE; 1-month cliff; then 100% linearly over the following 3 months

Interpretation: Three-month linear vesting starts at TGE for the base allocation. Bonus vesting starts only after its one-month cliff. Monthly checkpoints are shown below for clarity; contracts may implement continuous per-second vesting.

5. Worked example: $900 paid at a 10% discount

Item	PHOOD
Base purchased tokens	3,600,000
Voucher bonus tokens	400,000
Total allocation	4,000,000
Effective purchase price	$0.000225

6. Vesting schedule for the example

Checkpoint	Base vested (cumulative)	Bonus vested (cumulative)	Combined vested
TGE	1,080,000	0	1,080,000 (27.0%)
Month 1	1,920,000	0	1,920,000 (48.0%)

Checkpoint	Base vested (cumulative)	Bonus vested (cumulative)	Combined vested
Month 2	2,760,000	133,333	2,893,333 (72.3%)
Month 3	3,600,000	266,667	3,866,667 (96.7%)
Month 4	3,600,000	400,000	4,000,000 (100%)

7. Team and treasury

Category	Supply	Policy
Team	10% / 100M PHOOD	0% at TGE; 6-month cliff; then 18-month linear vesting
Project treasury	10% / 100M PHOOD	0% at TGE; managed as a disclosed multi-signature reserve, subject to a published use and release policy

The team and treasury are separate allocations. The treasury must not be represented as circulating simply because it is unlocked in a wallet; reserve governance, disclosure and wallet transparency remain essential.

Liquidity & operating rules

Capital-efficient initial listing with transparent reserve management.

8. Initial DEX liquidity

• 50% of actual USDT IDO proceeds is allocated to initial DEX liquidity; the remaining 50% stays in the project operating treasury.

• DEX opening price: $0.00025 per PHOOD (the non-discounted public IDO reference price).

• Liquidity is funded with an equal opening USDT value of PHOOD tokens from the 15% liquidity allocation. Pool mechanics, liquidity ownership and any removal rights should be published.

Actual IDO proceeds	USDT added to DEX	PHOOD paired	Operating proceeds
$10,000	$5,000	20,000,000	$5,000
$20,000	$10,000	40,000,000	$10,000
$30,000	$15,000	60,000,000	$15,000
$45,000	$22,500	90,000,000	$22,500
$50,000	$25,000	100,000,000	$25,000

The $50,000 row is a mechanical upper-bound scenario. With the full 200M-token sale allocation used at an average 10% discount, expected maximum proceeds are approximately $45,000. Actual fundraising depends on the mix of voucher discounts.

9. Dynamic unsold IDO reserve

Any portion of the 200M public IDO allocation that is not sold, including unused voucher-bonus capacity, moves to the Community & Ecosystem Reserve after the sale. It is not automatically transferred into free team inventory or immediate circulation.

Example: At $20,000 raised with an average effective 10% discount, approximately 88.89M tokens are allocated to buyers and 111.11M unsold tokens move to the reserve, raising its post-sale allocation from 35% to approximately 46.11%.

10. Implementation and disclosure checklist

• Keep base purchases and voucher bonus allocations in separately auditable vesting records; enforce the 200M combined sale-token limit and $50,000 proceeds cap.

• Publish vesting start time, exact cliff definitions, token-claim mechanics, wallet addresses, liquidity positions, custody policy and reserve release permissions before accepting funds.

• Set a clear minimum-raise policy, including whether a $10,000 shortfall triggers refunds, and publish jurisdictional participation restrictions based on legal review.

• Disclose voucher rules, anti-bot controls, eligibility checks, competition integrity policy, and the treatment of unclaimed rewards.

Status: Internal tokenomics framework. Final sale terms, legal structure, smart contracts, marketing rules and liquidity execution require independent review before launch. The FDV is a price-reference calculation, not a forecast or guarantee of secondary-market value.
